Introduction to Markdown and Modern Document Workflow

Jiawei Li

April 21, 2021

Frankfurt School of Finance & Management

Preface

Outline

- 1. Why Markdown?
- 2. Learn Markdown Syntax with Typora
- 3. Use R Markdown with RStudio

Material

Slides, notes and exercises are uploaded on GitHub: https://github.com/iewaij/talkMarkdown

Software

To follow the exercises, you need install Typora and RStudio.

Why Markdown?

Microsoft Word and LaTeX

Microsoft Word

- · No separation of content and formatting;
- · Bad code syntax highlighting, math equation and citation support;
- Hard to generate graphs and visualizations.

LaTeX

- · Source code is way too bloated;
- · Not really separate content from formats.

An LaTeX Example

```
\documentclass[12pt, a4paper]{article}
\usepackage[utf8]{inputenc}
\title{A Simple Document}
\author{Jiawei Li}
\date{April 2021}
\begin{document}
\maketitle
Some of the \textbf{greatest}
discoveries in \textit{science}
were made by \textbf{\textit{accident}}.
\end{document}
```

A Markdown Equivalent

```
title: A Simple Document
author: Jiawei Li
date: April 2021
fontsize: 12pt
papersize: a4
Some of the **greatest**
discoveries in *science*
were made by ***accident***.
```

Learn Markdown Syntax with Typora

Sections

The headers start with a hashtag (#). Using one hashtag means a level-one header. Two hashtags means a level-two header.

```
# Introduction
## Motivation
## History
### 1910s
### 1920S
# Main Texts
# Conclusion
```

Emphasize

Wrap asterisks (*) around the word to emphasize. One asterisk puts the work in italic and two asterisks put it in boldface.

```
Some of the **greatest**
discoveries in *science*
were made by ***accident***.
```

Numbered List

Put a number, followed by a period, at the start of a line and write the list item after it.

- 1. This is a numbered list.
- 2. Where this is list item two.
- 3. And this is list item three.
 - 1. A numbered list inside a list.
 - 2. This is item 3.2.

Unnumbered List

To create a unnumbered list, you simply put a dash (-) or an asterisk (*) in the beginning of the line.

- This is a unnumbered list.
- * Asterisk is fine.
- And this is list item three.
 - You can also indent a list here.

Quote

Add a > before the quoted text.

- > The idea is that a Markdown-formatted document should be publishable
- > as-is, as plain text, without looking like it's been marked up with
- > tags or formatting instructions.
- > If you want multiple lines where you include new lines,
- > you should add the `>` to each line.

Exercise 1: Countries' GDP

Open exercises/1_gdp.md with Typora and complete the following tasks:

- 1. Make a top level header "EU Countries Ordered by GDP".
- 2. Quote the famous "in the long run we all die" sentence by Keynes.
- 3. Create a numbered list of countries below ordered by their GDP. Note that some nations of The UK should be indented.
- 4. Emphasize Germany by making it bold.

Bonus: Strike out UK and its nations since it has left EU.

Links

Links can be created by using both [] and (), e.g.

[YouTube](https://youtube.com/)

The result will look like this:

YouTube

Syntax for inserting image is similiar to links with! in the beginning.

![FS Logo](figures/fslogo.png)

The result will look like this:

Figure 1: FS Logo

Inline Code

Inline code can be identified by backticks (`).

Variable can be assigned using `a = 12`.

The result will look like this:

Variable can be assigned using a = 12.

Code Block

Code block should be surrounded by three backticks.

```
python
print("Hello World!")
The result will look like this:
print("Hello World!")
```

Inline Math

Inline math follows the same logic of inline code. Inline math is wrapped by the dollar sign (\$).

Here we define m = ab.

The result will look like this:

Here we define m=ab.

Math Block

A math block is surrounded by two dollar signs (\$).

We know that

$$e = mc^2$$

\$\$

The result will look like this:

We know that

$$e = mc^2$$

Math Block

You may find Mathpix, an OCR tool for math equations, very helpful.

Exercise 2: Badges and Stuff

Shields.io is a website that generates badges. Open exercises/2_badges.md with Typora and complete the following tasks:

- 1. Create two YouTube channel badges which are linked to a YouTube Channel.
- 2. Create a thumbnail image stored in **figures** folder which is also linked to a YouTube video.
- 3. Finish off with a line of Python code and a math equation.

Bonus: Add another formula which is Euler's identity.

$$e^{i\pi} + 1 = 0$$

Use R Markdown with RStudio

Metadata

The Markdown file can include metadata that describes the formats and detailed information, e.g. title and author.

```
title: A Report Genrated by R Markdown
author: Jiawei Li
date: 21 April, 2021
abstract: Here are some words.
output: pdf_document
---
```

Some texts.

Metadata

```
geometry:
  - top=30mm
  - left=30mm
  - right=30mm
  - bottom=30mm
fontsize: 12
documentclass: report
output:
  pdf document:
    toc: true
    number_sections: true
```

Pagebreak

You can also create intentional page breaks.

```
toc: true
documentclass: article
\pagebreak
Some texts.
\pagebreak
```

References

Citations

Citations can be inserted in the header as well, though you need generate a BibTex file from ZoteroBib and a specific citation style file from Zotero Style Repository.

```
bibliography: citation.bib
csl: harvard-cite-them-right.csl
---
```

Exercise 3: Thesis

Open exercises/3_thesis.Rmd with RStudio and complete the following tasks:

- 1. Generate a thesis with title, author, date, abstract and a table of contents.
- 2. The thesis should use "report" as documentclass.
- 3. Cite the book "Forecasting: Principles and Practice".

Bonus: Number each section. For example, "Introduction" has a "Chapter 1" before it. You may not write these texts explicitly.

Tables

You can generate tables using Markdown syntax only.

	Country	GDP	
	Germany	4,319,286	
	United Kingdom	3,124,650	
	France	2,938,271	
	Italy	2,106,287	
	Spain	1,461,552	
	Netherlands	1,012,598	
Table Title: This is table caption			

Table Title: This is table caption

Tables

Run the code to generate a table. Simply add a $\{r\}$ in your code fence, the code then become executable in RStudio.

```
```{r, include = FALSE, echo = FALSE}
library(tidyverse)
library(knitr)
```
{r}
kable(mpg[1:5,], caption = "A table")
```
```

# Graphs

You can also generate graphs for you the report.

```
'``{r, caption = "A graph"}
ggplot(data = mpg) +
 geom_point(mapping = aes(x = displ, y = hwy, color = class))
```

### **Templates**

Install **stevetemplates** and **binb**, then you can start using the templates when create a new R Markdown document.

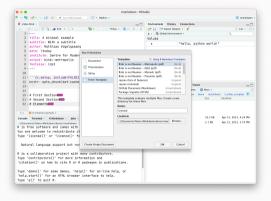

Figure 2: Start with a Template

### **How R Markdown Works**

Figure 3: R Markdown Worlflow

Internally, R Markdown run the R code in the file and insert the code's output into the text you wrote. The file will then be translated into a PDF or html using Pandoc.

If you are comfortable with command line and do not need code execution, simply run like this:

pandoc --citeproc --pdf-engine=xelatex -o your\_work.pdf your\_work.md

# Conclusion

We shape our tools and our tools shape us. – Marshall McLuhan  $\,$
